Practice workbook · Gibson's direct theory of perception

Bottom-up perception from sensory input via optic flow, invariants and affordances, with its strengths and weaknesses.

3 question parts: 1 worked-example retry and 2 further practice parts.
Name: _____ Class: _____ Date: _____

Practise one question type at a time. Attempt the part inside the red boundary; the rest of the question and any figures are kept for context. Write your working in the answer space.

The first question is a retry of the website worked example, without its solution. Check your answers online with 'Check my answer', or ask your teacher for the answer booklet.

***26** Liz was on a train looking out of the window. Although she did not feel like she was moving, she knew the train was travelling very fast. Liz could see a church and although the features of the church building were blurred and unclear, she knew it was far away. She could also see fields and trees stretching into the distance.

Liz became aware that the train was slowing down, even though she could not hear the sound of it slowing down. Liz stood up and began to gather her belongings, but when she looked through the window of the train, she saw that the station was smaller than the trees she could also see, so she sat back down.

Assess how well the Direct Theory of Perception (Gibson, 1966) can explain how Liz was able to interpret her surroundings.

2020 NOV · Paper 02

Further practice · Attempt part whole only.

***26** Kim was walking through the park. She noticed the leaves on the trees were turning brown and that there were not very many flowers.

Kim passed a small pond where there were ducks and swans moving away from the edge of the pond. In the distance Kim could see a river and horses.

As Kim walked down a path she saw two people running towards her wearing sports clothes. She continued to walk without being worried about the strangers running towards her.

Assess whether the Direct Theory of Perception (Gibson, 1966) can explain how Kim was able to interpret her surroundings.

2022 JUN · Paper 02

Further practice · Attempt part whole only.

23 Malik is using a flight simulator video programme. When he is in the simulator, he can determine the direction and speed of his flight even though he is not physically moving.

The flight instructor says this is because the objects in the flight simulation video have been programmed to move through the visual field at different speeds.

Explain, using optic flow, why the objects are programmed to move at different speeds.

(Total for Question 23 = 2 marks)
