Practice workbook · Drawing conclusions from data

Using figures in a table to support or state a conclusion about a difference between conditions or groups.

24 question parts: 1 worked-example retry and 23 further practice parts.
Name: _____ Class: _____ Date: _____

Practise one question type at a time. Attempt the part inside the red boundary; the rest of the question and any figures are kept for context. Write your working in the answer space.

The first question is a retry of the website worked example, without its solution. Check your answers online with 'Check my answer', or ask your teacher for the answer booklet.

1. Question 4 · part b · 2 marks

2025 JUN · Paper 02

Worked-example retry · Attempt part b only.

4 A school is implementing a ban on unhealthy food.

Davide is interested to see whether young people would change their attitude towards eating unhealthy food due to the ban. 10 participants aged 11 to 16 years old from the school were asked to rate whether you should eat unhealthy food, using a scale of 1 to 10, with 1 being 'should never eat it' and 10 being 'should eat it every day'.

Davide tested the participants two months before the ban and again two months after the ban was put in place.

The results of Davide's study are shown in **Table 4**.

Participant	Attitude towards eating unhealthy food before the ban (1–10)	Attitude towards eating unhealthy food after the ban (1–10)
A	8	6
B	7	6
C	7	4
D	4	1
E	8	5
F	9	5
G	7	5
H	6	4
I	7	3
J	10	7

15 Jasper is investigating the impact mental health issues have on individuals.

He visits a number of countries and carries out structured interviews using pre-determined questions with people with mental health issues. Jasper collates the information and categorises the scores on three measures.

- Likelihood of feeling shunned: experiencing being avoided by people after diagnosis
- Likelihood of feeling isolated: experiencing being alone after diagnosis
- Likelihood of being given better treatment: experiencing benefits after diagnosis

He categorises the scores as 'High', 'Mid', or 'Low' for each of the themes.

Table 1 shows Jasper's results.

Country	Likelihood of feeling shunned	Likelihood of feeling isolated	Likelihood of being given better treatment
England	MID	MID	MID
Germany	HIGH	HIGH	LOW
Italy	HIGH	HIGH	LOW
Bulgaria	HIGH	MID	LOW
Croatia	MID	HIGH	LOW
France	HIGH	HIGH	MID
Finland	MID	MID	MID

14 Jonah is investigating the influence of different information on whether patients will consider using cognitive behavioural therapy (CBT) for depression.

Jonah gave a group of patients with depression one of two information articles.

- Article one included a case study of a woman with depression who attended CBT sessions and her symptoms reduced over time (group 1).
- Article two included some research evidence supporting the effectiveness of CBT for depression (group 2).

After each group of patients had read their information article, they had to rate how convincing they found the information article for helping with depression and how likely they were to attend CBT.

The articles were rated by the patients on a scale of 1–10, where 1 was extremely unconvinced and unlikely to attend CBT and 10 was extremely convinced and extremely likely to attend CBT.

Table 3 shows a summary of Jonah's results.

Group	Average rating of how convinced they were of CBT helping with their depression (1–10)	Average likelihood of attending CBT after reading the information article (1–10)
Group 1: patients given an information article that included a case study	8.7	7.0
Group 2: patients given an information article that included research evidence	6.5	7.1

12 Maddie has been diagnosed with depression.

She has stopped going to work as she constantly feels intense sadness and cannot find the motivation to speak to anyone.

Her mum tries to encourage and reassure her, but Maddie says there is no point as she will always be a failure. Maddie says work is pointless as she claims her recent performance review was worse than she expected. She also thinks she will never get a promotion or a partner.

(a) Explain how cognitive theory could account for Maddie's depression.

(2)

(b) Explain **one** strength and **one** weakness of using cognitive theory to account for Maddie's depression.

(c) Maddie's psychiatrist is considering whether to use drugs as a treatment for her depression. She is interested to see how a new antidepressant drug called 'H3-a' compares to a standard antidepressant.

Maddie's psychiatrist looks at clinical trial data for the new drug and compares it to the standard antidepressant in terms of relapse in symptoms and the possibility of Maddie experiencing side effects after taking the drug.

The data she is considering is shown in **Table 1**.

	New antidepressant 'H3-a'	Standard antidepressant
Average percentage (%) of patients reporting relapse in symptoms after 1 year	22	35
Average percentage (%) of patients reporting severe side effects	25	15

Table 1

Explain **one** conclusion that Maddie's psychiatrist could make regarding the new antidepressant drug 'H3-a' compared to the standard antidepressant using **Table 1**.

17 Mattéo is investigating the impact of a treatment to help patients with severe prosopagnosia.

Mattéo recruited 10 patients with severe prosopagnosia. He gave half of his patients an 11-week face training programme which involved showing 12 faces at different angles, with different emotional expressions. The other half of his patients were put into a control group, where they watched TV instead of being involved in the training sessions.

Before and after the investigation, all the patients had their performance on a face task recorded, which involved them deciding which of the faces resembled a target face the most.

Mattéo's average results are shown in **Table 2**.

Group	Average performance on the face task before the investigation (% correct)	Average performance on the face task after the investigation (% correct)
Training programme	41	60
Control	39	38

14 Christian is a researcher who is investigating the use of drugs for treating addiction.

He is testing how effective a new drug called 'rndo-7' is for reducing the symptoms of addiction. To test the effectiveness of 'rndo-7', Christian recruits 1,200 patients from across the world to take part in his investigation. All of the patients have been addicted to the same drug for at least 6 months and have volunteered to take part in the trials.

Christian splits the participants into three groups.

Group A – participants who will take the new drug 'rndo-7'.

Group B – participants who will take an established, already commonly used drug.

Group C – participants who will take no drug and will act as the control group.

Before and at the end of the investigation, participants were asked to rate the severity of their symptoms on a scale of 1–10, where 10 indicated extremely severe symptoms and 1 indicated no symptoms at all.

The average symptom severity for Christian's investigation is shown in **Table 3**.

Group	Group A	Group B	Group C
Symptom severity (1–10) before the investigation	6.8	9.8	7.6
Symptom severity (1–10) at the end of the investigation	6.5	6.5	7.3

19 Mikel was investigating the role of the hemispheres of the brain.

He recruited a participant with damage to their left hemisphere and another participant with damage to their right hemisphere.

Mikel gave the participants two tasks.

Task 1 – Word category task – the participant had to pick one word from a selection of four that fitted a different category of words to the other three (see **Figure 3**).

Task 2 – Shape category task – the participant had to pick one shape from a selection of four that fitted a different category of shapes to the other three (see **Figure 3**).

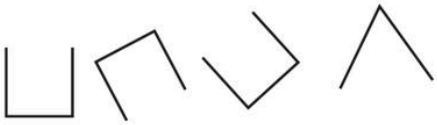

Word category task example	Shape category task example
teacher doctor lamp poet	

Figure 3

Each participant was given 25 task items to respond to and their total number of correct responses was recorded.

Mikel's results are shown in **Table 4**.

	Task 1 – percentage of correct responses	Task 2 – percentage of correct responses
Participant with damage to the left hemisphere of the brain	4%	8%
Participant with damage to the right hemisphere of the brain	92%	6%

13 Mary wanted to see the influence of life events on depression. Mary recruited participants from a local business who had experienced or were currently experiencing depression.

Mary gave the participants a closed-ended questionnaire which asked them about the type and number of stressful life events they had experienced in the past five years. She also asked them about the length of time (in months) they had experienced depressive symptoms and the severity of their depression, on a scale of 0–32, where 32 indicated extremely severe symptoms.

Mary's results are shown in **Table 2**.

Stressful life events (past five years)	Average length of depressive symptoms (in months)	Average severity of depressive symptoms (0–32)
0–5	6.3	12.5
6–10	12.4	13.2
11–15	15.3	12.7
16+	25.6	12.9

24 Kyle is waiting for an underground train. He is going to an important meeting.

He sees a drunk man trip and fall on the platform just as his train is about to leave. Kyle knows that if he stops to help, he will be late for his meeting.

Kyle stops to help the drunk man and misses his train.

(a) Explain why Kyle may have decided to help the drunk man.

You should refer to pro-social behaviour in your answer.

(2)

(b) Kyle's female colleague, Joanne, did not stop to help the drunk man with Kyle and boarded the train.

Explain why Joanne may have chosen not to help the drunk man and boarded the train.

You should refer to Piliavin et al. (1969) in your answer.
