Type MS · Gibson's direct theory of perception

Answer 1 of 3 · Question 26 part whole · 9 marks

2023 JUN · Paper 02 · extract 1 of 3 · find part whole in this mark scheme extract

Question number	Indicative content	Mark
26	AO1 = 3 marks; AO2 = 3 marks; AO3 = 3 marks Markers must apply the descriptors in line with the general marking guidance (on pages 2–3). Due to the intrinsic links between the skills, if a response evidences performance against only one trait/skill it will be for demonstrating knowledge and understanding. An answer displaying qualities of AO1 only, cannot be awarded more than the top of Level 1, no matter how strong the performance is in AO1. AO1 • Gibson (1966) suggests that changes in the flow of the optic array contain information about any movement taking place. • Direct perception of the texture gradient of an object indicates distance as the grain becomes smoother and less distinct. • The use of relative size helps indicate when an object is far away from the eye as the object appears smaller. AO2 • Liz was able to see the direction and speed at which objects out of the window passed through her visual field so she could perceive that the train was travelling fast. • Liz was able to determine the church as far away because the features of the church building were blurry and not clear indicating it was in the distance. • Liz was able to understand that the train was still quite far from the station as the station appeared smaller in comparison to the trees, indicating it was far away from the train. AO3 • Gibson (1966) is a reductionist theory as it focuses solely on sensory input and ignores factors such as emotion or motivation that can influence a person's perception so does not fully explain perception. • Gibson and Walk (1960) found that babies would not crawl over a perceived 'cliff edge', which suggests depth perception is an innate trait providing humans with depth cues to interpret their surroundings, which can account for how Liz was able to interpret depth. • Direct theory of perception cannot account for misinterpretations of visual input such as illusions where prior knowledge is used, therefore it may not fully account for the way Liz interpreted her surroundings.	**(9)**

Level	Mark	Descriptor
	0	No rewardable material.
Level 1	1–3	• Demonstrates isolated elements of knowledge and understanding of a limited range of psychological ideas (AO1). • Provides little or no reference to relevant psychological ideas related to the context (AO2). • Limited attempt to deconstruct relevant psychological ideas. Limited consideration of supporting/refuting evidence, leading to generic judgements (AO3).
Level 2	4–6	• Demonstrates mostly accurate understanding of some relevant psychological ideas (AO1). • Provides some reference to relevant psychological ideas related to the context but this may be limited or lack relevance at times (AO2). • Deconstructs relevant psychological ideas using mostly logical chains of reasoning. Some consideration of supporting/refuting evidence, leading to a judgement (AO3).
Level 3	7–9	• Demonstrates accurate and thorough knowledge and understanding of relevant psychological ideas (AO1). • Provides sustained reference to relevant psychological ideas related to the context (AO2). • Deconstructs relevant psychological ideas using logical chains of reasoning. Sustained consideration of supporting/refuting evidence, showing an awareness of competing arguments, leading to a judgement (AO3).

Question number	Indicative content	Mark
26	AO1 = 3 marks; AO2 = 3 marks; AO3 = 3 marks Markers must apply the descriptors in line with the general marking guidance (on pages 2–3). Due to the intrinsic links between the skills, if a response evidences performance against only one trait/skill it will be for demonstrating knowledge and understanding. An answer displaying qualities of AO1 only, cannot be awarded more than the top of Level 1, no matter how strong the performance is in AO1. AO1 • Direct theory claims that optic array is the visual information at the retina and optic flow provides the information on movement or location. • Gibson claimed that invariants, such as texture gradient where texture is less defined as things get further away, provide optic information to perceive scenes. • The concept of affordances suggests that all the information needed to make sense of surroundings is present in the visual input. AO2 • Kim was able to interpret the two people were running as a result of the optic flow of information about their speed coming towards her. • The river in the distance would have less clear texture gradients so the invariant provided Kim with the perception of the river as being far away. • Kim was not afraid of the people running towards her as they were wearing sports clothing which suggests she used prior knowledge of how people look when running for exercise. AO3 • Warren and Hannon (1988) found people could judge direction of movement from just optic flow information, so Kim would be able to interpret the direction of the runners without needing any prior understanding. • Invariants may help distance perception but cognitive processing would be required to determine the object perceived as a river or a horse, so direct theory may only partially explain Kim's interpretation of her surroundings. • Direct theory ignores prior knowledge that can be used to interpret our environment, such as a schema for sportswear when running, so Gibson (1966) does not fully explain how Kim can interpret her surroundings.	**(9)**

Answer 3 of 3 · Question 23 part whole · 2 marks

2022 JUN · Paper 02 · extract 1 of 2 · find part whole in this mark scheme extract

Question number	Answer	Mark
23	**One** mark for accurate understanding of optic flow. **One** mark for exemplification of how optic flow can be used to explain the scenario. For example: • Gibson (1966) suggested that optic flow is the perception of movement from the observer's motion through an environment (1) so the flight simulator video is programmed to provide an optic flow of faster movement for objects close by and slower for objects in the distance (1). Accept any other appropriate response.	**(2)**
