2025 JUN · Paper 02

Worked-example retry · Attempt part a only.

3 Davina investigated the relationship between the time spent on psychology homework and end of topic test scores.

Davina asked her students to write down the average time (in minutes) they spent on their homework each week and she also recorded their end of topic test scores (out of 30 marks).

Davina's results are shown in **Table 3**.

Participant	Average time spent on homework (in minutes)	End of topic test scores (out of 30 marks)
A	50	17
B	25	10
C	30	15
D	20	10
E	55	25
F	15	9
G	80	30
H	50	19
I	60	27
J	20	14

Table 3

2025 JUN · Paper 02

Worked-example retry · Attempt part c only.

4 A school is implementing a ban on unhealthy food.

Davide is interested to see whether young people would change their attitude towards eating unhealthy food due to the ban. 10 participants aged 11 to 16 years old from the school were asked to rate whether you should eat unhealthy food, using a scale of 1 to 10, with 1 being 'should never eat it' and 10 being 'should eat it every day'.

Davide tested the participants two months before the ban and again two months after the ban was put in place.

The results of Davide's study are shown in **Table 4**.

Participant	Attitude towards eating unhealthy food before the ban (1–10)	Attitude towards eating unhealthy food after the ban (1–10)
A	8	6
B	7	6
C	7	4
D	4	1
E	8	5
F	9	5
G	7	5
H	6	4
I	7	3
J	10	7

5 Leanne is investigating children's development at a local school. She asks 30 pupils, aged 6 years old, 8 years old and 10 years old, to participate in her investigation.

Leanne asks the pupils to come to the gymnasium and put on a virtual reality (VR) headset, where they will see a simulation of a set of buildings. The buildings are different shapes and colours.

- A triangular blue building.
- A square red building.
- A rectangular black building.

From the pupils' perspective, the triangular building is at the front and the rectangular building is at the back of the image. The pupils are asked to say what a person living on the opposite side of the town will see.

Table 1 shows the overall responses given by the pupils.

Pupil age	Number of pupils who said the triangular building would be at the front and the rectangular building would be at the back	Number of pupils who said the rectangular building would be at the front and the triangular building would be at the back
6 years old	26	4
8 years old	13	17
10 years old	3	27

11 Lydia wants to investigate the effects of a new painkiller on memory. She wants to see if the new painkiller affects people's ability to remember new information. Lydia recruits male participants from her local town for her investigation.

Lydia has two conditions:

- No painkiller – The male participants are shown three pictures. One hour later, the participants have to pick the three pictures from a selection of nine pictures.
- Painkiller – The same male participants are given the new painkiller. The participants are shown three new pictures. One hour later, the participants have to pick the three pictures from a selection of nine pictures.

Lydia's results are shown in **Table 2**.

Condition	Average number of pictures correctly recognised (out of 3)
No painkiller	2.9
Painkiller	1.1

15 Jasper is investigating the impact mental health issues have on individuals.

He visits a number of countries and carries out structured interviews using pre-determined questions with people with mental health issues. Jasper collates the information and categorises the scores on three measures.

- Likelihood of feeling shunned: experiencing being avoided by people after diagnosis
- Likelihood of feeling isolated: experiencing being alone after diagnosis
- Likelihood of being given better treatment: experiencing benefits after diagnosis

He categorises the scores as 'High', 'Mid', or 'Low' for each of the themes.

Table 1 shows Jasper's results.

Country	Likelihood of feeling shunned	Likelihood of feeling isolated	Likelihood of being given better treatment
England	MID	MID	MID
Germany	HIGH	HIGH	LOW
Italy	HIGH	HIGH	LOW
Bulgaria	HIGH	MID	LOW
Croatia	MID	HIGH	LOW
France	HIGH	HIGH	MID
Finland	MID	MID	MID

4 Pedro was investigating whether schemas have an influence on memory accuracy. He decided to test four students from his psychology class.

He placed 10 typical objects, such as a chair, and 10 unusual objects, such as a laundry basket, in a classroom. The students had to enter the room and look around for one minute.

Pedro recorded the number of typical objects and unusual objects students could remember.

The results of Pedro's investigation are shown in **Table 1**.

	Number of typical objects recalled (out of 10)	Number of unusual objects recalled (out of 10)
Student A	8	3
Student B	10	5
Student C	9	5
Student D	5	2

Table 1

1 Thomas recruited participants to investigate obedience to authority. The participants were asked to attend a university.

They were allocated to one of two conditions:

- Condition A: 30 participants were instructed to answer general knowledge questions in silence for 40 minutes by a man dressed in a uniform.
- Condition B: 30 participants were instructed to answer general knowledge questions in silence for 40 minutes by a man dressed in jeans and a t-shirt.

Thomas recorded how many participants obeyed the instruction to remain silent.

(a) Identify the dependent variable (DV) in Thomas' investigation.

(1)

- ☒ **A** Whether the man was wearing a uniform or jeans and a t-shirt.
- ☒ **B** The amount of time participants were given to answer the questions.
- ☒ **C** The number of participants who obeyed the man's instruction to remain silent.
- ☒ **D** The number of general knowledge questions participants were instructed to answer.

(b) Describe **one** participant variable that Thomas may have considered when conducting his investigation.

15 Jasper is investigating the impact mental health issues have on individuals.

He visits a number of countries and carries out structured interviews using pre-determined questions with people with mental health issues. Jasper collates the information and categorises the scores on three measures.

- Likelihood of feeling shunned: experiencing being avoided by people after diagnosis
- Likelihood of feeling isolated: experiencing being alone after diagnosis
- Likelihood of being given better treatment: experiencing benefits after diagnosis

He categorises the scores as 'High', 'Mid', or 'Low' for each of the themes.

Table 1 shows Jasper's results.

Country	Likelihood of feeling shunned	Likelihood of feeling isolated	Likelihood of being given better treatment
England	MID	MID	MID
Germany	HIGH	HIGH	LOW
Italy	HIGH	HIGH	LOW
Bulgaria	HIGH	MID	LOW
Croatia	MID	HIGH	LOW
France	HIGH	HIGH	MID
Finland	MID	MID	MID

14 Jonah is investigating the influence of different information on whether patients will consider using cognitive behavioural therapy (CBT) for depression.

Jonah gave a group of patients with depression one of two information articles.

- Article one included a case study of a woman with depression who attended CBT sessions and her symptoms reduced over time (group 1).
- Article two included some research evidence supporting the effectiveness of CBT for depression (group 2).

After each group of patients had read their information article, they had to rate how convincing they found the information article for helping with depression and how likely they were to attend CBT.

The articles were rated by the patients on a scale of 1–10, where 1 was extremely unconvinced and unlikely to attend CBT and 10 was extremely convinced and extremely likely to attend CBT.

Table 3 shows a summary of Jonah's results.

Group	Average rating of how convinced they were of CBT helping with their depression (1–10)	Average likelihood of attending CBT after reading the information article (1–10)
Group 1: patients given an information article that included a case study	8.7	7.0
Group 2: patients given an information article that included research evidence	6.5	7.1

14 Christian is a researcher who is investigating the use of drugs for treating addiction.

He is testing how effective a new drug called 'rndo-7' is for reducing the symptoms of addiction. To test the effectiveness of 'rndo-7', Christian recruits 1,200 patients from across the world to take part in his investigation. All of the patients have been addicted to the same drug for at least 6 months and have volunteered to take part in the trials.

Christian splits the participants into three groups.

Group A – participants who will take the new drug 'rndo-7'.

Group B – participants who will take an established, already commonly used drug.

Group C – participants who will take no drug and will act as the control group.

Before and at the end of the investigation, participants were asked to rate the severity of their symptoms on a scale of 1–10, where 10 indicated extremely severe symptoms and 1 indicated no symptoms at all.

The average symptom severity for Christian's investigation is shown in **Table 3**.

Group	Group A	Group B	Group C
Symptom severity (1–10) before the investigation	6.8	9.8	7.6
Symptom severity (1–10) at the end of the investigation	6.5	6.5	7.3

4 Two P.E. teachers motivate their pupils differently in their lessons. The assistant head teacher wants to see how this affects the number of times each pupil attempts to break the school records in athletics.

Mr Kirkman praised pupil effort when they were running the 100m and doing the long jump. Mr Moakler praised pupil ability when they were running the 1500m and doing the high jump.

Each pupil was allowed a maximum of 10 attempts to try to break the school record for each event. The assistant head teacher measured the average number of attempts each pupil made to beat the school records.

Figure 1 shows the findings.

11 Niamh wanted to see how music lyrics could most accurately be remembered.

She asked one group of participants to watch the first music video that came on television and a second group of participants to listen to the first song that came on the radio.

Niamh later asked participants to write down all the lyrics they could remember from the song they heard. She then calculated the average percentage of lyrics recalled accurately for each group.

Her results are shown in **Figure 3.**

A bar chart to show the average percentage of lyrics recalled accurately by the participants who watched a music video or listened to the radio

5 James is a teacher at a school. He wants to see whether social learning can be used to help the social development of his pupils.

He splits a group of 10 pupils in half, keeping five of the pupils in his classroom while another teacher takes the other five pupils to their classroom. James shows them how to share and take turns on a scooter and asks them to practise this whilst he watches and supervises them. The other teacher just gives the pupils a scooter and supervises only. This is done once a day for a week.

The following week James observes his whole class and gives each of the 10 pupils a score for their ability to share and take turns. The pupils were scored from 1 to 10, where 1 indicated very poor ability to share and take turns and 10 indicated excellent ability to share and take turns.

Table 1 shows the scores given to each pupil by James.

Supervised by James		Supervised by the other teacher	
Pupil	**Ability to share and take turns (1–10)**	**Pupil**	**Ability to share and take turns (1–10)**
A	8	F	4
B	9	G	5
C	8	H	5
D	7	I	4
E	9	J	6

9 Nishka was interested in the amount of numbers that a person could remember over a short period of time.

She presented a group of participants with seven number lists. The number lists were shown one by one to the group. Each number list increased in length with each successive trial, up to a maximum of 10 numbers (see **Figure 3**).

Nishka's number lists

Trial 1:	**8**	**1**	**5**	**0**					
Trial 2:	**4**	**2**	**3**	**9**	**6**				
Trial 3:	**3**	**8**	**1**	**0**	**4**	**5**			
Trial 4:	**2**	**7**	**1**	**5**	**6**	**9**	**1**		
Trial 5:	**5**	**0**	**2**	**1**	**7**	**3**	**8**	**4**	
Trial 6:	**0**	**2**	**9**	**1**	**3**	**0**	**4**	**7**	**5**
Trial 7:	**1**	**6**	**2**	**7**	**8**	**4**	**1**	**3**	**5**	**2**

Figure 3

14 Jonah is investigating the influence of different information on whether patients will consider using cognitive behavioural therapy (CBT) for depression.

Jonah gave a group of patients with depression one of two information articles.

- Article one included a case study of a woman with depression who attended CBT sessions and her symptoms reduced over time (group 1).
- Article two included some research evidence supporting the effectiveness of CBT for depression (group 2).

After each group of patients had read their information article, they had to rate how convincing they found the information article for helping with depression and how likely they were to attend CBT.

The articles were rated by the patients on a scale of 1–10, where 1 was extremely unconvinced and unlikely to attend CBT and 10 was extremely convinced and extremely likely to attend CBT.

Table 3 shows a summary of Jonah's results.

Group	Average rating of how convinced they were of CBT helping with their depression (1–10)	Average likelihood of attending CBT after reading the information article (1–10)
Group 1: patients given an information article that included a case study	8.7	7.0
Group 2: patients given an information article that included research evidence	6.5	7.1

3 Alessia is a teacher at a school and is trying to help students learn a new concept in science class.

Alessia split her students into three groups to see who would learn the new concept the most effectively.

- Group 1 – the students were asked to do a very easy task about the new concept, with only very simple activities included.
- Group 2 – the students were asked to do a reasonably difficult task about the new concept, with some slightly more challenging activities included.
- Group 3 – the students were asked to do a very hard, complex task about the new concept, with only extremely challenging activities included.

Alessia asked her students to do the activities in their groups over the course of a week during lessons. At the start and the end of the week the students took the same test about the new science concept.

Alessia wanted to make some conclusions about how the tasks given affected the students' performance in the test.

Figure 1 shows the average performance of the three groups at the start and the end of the week.

9 Dekota wanted to investigate the difference between retrograde and anterograde amnesia.

She asked one participant with retrograde amnesia and one participant with anterograde amnesia to perform two tasks and recorded their performance.

Task 1: A complex picture was shown to the participants. The participants were asked to reproduce the picture after a 15-minute delay. The reproduction of the picture was scored out of 36.

Task 2: Participants were asked 100 factual questions about real news events that occurred before they suffered from amnesia.

Dekota compared the performance of her two participants with a control participant who did not suffer from amnesia.

Table 1 shows Dekota's results.

	Task 1 Picture task (score out of 36)	Task 2 News events task (score out of 100)
Participant with retrograde amnesia	26	40
Participant with anterograde amnesia	8	80
Control participant with no amnesia	33	97

17 Mattéo is investigating the impact of a treatment to help patients with severe prosopagnosia.

Mattéo recruited 10 patients with severe prosopagnosia. He gave half of his patients an 11-week face training programme which involved showing 12 faces at different angles, with different emotional expressions. The other half of his patients were put into a control group, where they watched TV instead of being involved in the training sessions.

Before and after the investigation, all the patients had their performance on a face task recorded, which involved them deciding which of the faces resembled a target face the most.

Mattéo's average results are shown in **Table 2**.

Group	Average performance on the face task before the investigation (% correct)	Average performance on the face task after the investigation (% correct)
Training programme	41	60
Control	39	38

19 Mikel was investigating the role of the hemispheres of the brain.

He recruited a participant with damage to their left hemisphere and another participant with damage to their right hemisphere.

Mikel gave the participants two tasks.

Task 1 – Word category task – the participant had to pick one word from a selection of four that fitted a different category of words to the other three (see **Figure 3**).

Task 2 – Shape category task – the participant had to pick one shape from a selection of four that fitted a different category of shapes to the other three (see **Figure 3**).

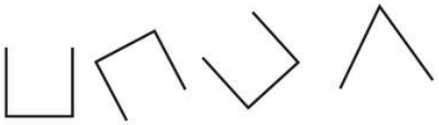

Word category task example	Shape category task example
teacher doctor lamp poet	

Figure 3

Each participant was given 25 task items to respond to and their total number of correct responses was recorded.

Mikel's results are shown in **Table 4**.

	Task 1 – percentage of correct responses	Task 2 – percentage of correct responses
Participant with damage to the left hemisphere of the brain	4%	8%
Participant with damage to the right hemisphere of the brain	92%	6%

20 Ada wanted to see how the presence of others could influence exercise behaviour. She went to her local gym and recruited four volunteers to take part in her study as confederates / stooges.

Ada asked the confederates / stooges to run on the majority of the five running machines in the gym during the busy two-hour period, both in the morning and afternoon sessions. The fifth running machine was always left vacant.

Ada recorded, in minutes, how long the fifth running machine was used for in the morning and afternoon sessions, over a three-day period.

Ada's findings are shown in **Table 3**.

	Average time (mins) the fifth running machine was used in the morning session		Average time (mins) the fifth running machine was used in the afternoon session	
	No confederates / stooges	With confederates / stooges	No confederates / stooges	With confederates / stooges

23 Hannah was investigating how obedient people would be to an authority figure.

She got permission from a train station to conduct her investigation during a busy rush hour period. Passengers were requested to only leave the train station via one of the exits by an authority figure.

Hannah compared the findings from three variations:

Variation A: the request was given in person or over a loudspeaker.

Variation B: the request was given by a man who wore a uniform or casual clothes.

Variation C: the request was given by a male or female authority figure.

Hannah's results are shown in **Table 5**.

	Variation A: Authority figure presence		Variation B: Clothes worn by authority figure		Variation C: Gender of authority figure	
	In person	Loudspeaker	Uniform	Casual	Male	Female
% obedience	30	10	45	15	30	30

Worked-example retry · Attempt part whole only.

***6** Rosenhan (1973) studied the way in which patients were treated in mental health hospitals. Eight confederate observers were able to get themselves admitted to different psychiatric wards in different hospitals using fake symptoms of mental health. They then conducted participant observations on the hospital wards.

The confederate observers took part in the daily activities on the ward to fit in with the actual patient routines. They also watched how the staff interacted with patients, making detailed notes in diaries of the events they observed. These notes included examples about patient behaviours that had been misinterpreted by the staff. They also recorded how little time the nurses and doctors spent on the ward interacting with patients.

None of the staff or patients on the wards were aware that the observations were taking place. When the confederate observers were taking notes and writing in their diaries in public, their behaviour was interpreted as part of their mental health condition. Only the other patients on the ward showed any suspicion about the notes being taken by the confederate observers.

Evaluate the use of an observation to investigate human behaviour.

***7** Ainsworth et al. (1978) investigated the emotional bond of attachment. They conducted structured observations of infant responses to their mother and a stranger.

A room was designed for the infant and mother to use, which contained toys for the infant to play with during the observation.

Each mother was aware that they were taking part in an eight-phase standardised procedure during the observation. The behaviour of the infant was written down during each of these eight phases without the infant knowing.

An example of the type of behaviour recorded was whether the infant was distressed when the mother left the infant alone with a stranger.

Evaluate the use of the observation research method to investigate human behaviour.

***5** H.M. underwent an experimental brain operation in 1953 where doctors removed most of his hippocampus and amygdala. It became clear that as a result of the operation H.M. had an impaired long-term memory, but his short-term memory and some other skills were largely intact.

H.M. was studied from the day of his operation until he died in 2008. He took part in experimental tasks, some of these he repeated regularly. H.M. was observed by multiple researchers over his lifetime, and his amnesia was compared to that of other amnesiac patients to see if memory loss was similar.

His case provided psychologists with a range of information about memory processes that may otherwise not have been understood.

Evaluate the use of case studies to investigate human behaviour.

Worked-example retry · Attempt part whole only.

***5** Schaffer and Emerson (1964) conducted interviews with the mothers of 37 infants. The interviews took place at four-weekly intervals, in their family home, over a period of 12 months.

The interviews were unstructured and used open-ended questions to gather information about an infant's reaction to physical contact with their mother. The behaviours the researchers focused on included:

- how the infant reacted when cuddled on their mother's knee
- whether the infant tried to get physical contact
- whether the infant avoided physical contact
- the mother's reaction to the infant's contact behaviours.

Mothers were encouraged to give full descriptions of their infant's behaviours. Often mothers would provide demonstrations of the behaviours that they had highlighted previously, without being asked.

Schaffer and Emerson (1964) found two groups of infants, which they named 'Cuddlers' and 'Non-cuddlers', with typical responses including 'loves being handled' or 'restless until put back in cot'.

Evaluate the use of unstructured interviews to investigate human behaviour. **(12)**

***7** Buss and Perry (1992) developed the Buss–Perry Aggression Questionnaire (BPAQ) to test levels of aggression in adults.

Participants completing the questionnaire select how far they agree with each of the 29 statements using a five-point scale. The scores for each statement are then totalled to determine aggression levels.

Figure 1 shows example statements and the five-point scale.

Statement	Extremely uncharacteristic	Somewhat uncharacteristic	Neither uncharacteristic nor characteristic	Somewhat characteristic	Extremely characteristic
1. My friends say that I'm somewhat argumentative.	✓				
2. I tell my friends openly when I disagree with them.				✓	

(Source: adapted from Buss and Perry (1992) Buss–Perry Aggression Questionnaire)

Figure 1

The BPAQ can be administered online or on paper and has continued to be used to measure aggression levels in the adult population. Some researchers have also adapted the questionnaire for different countries and cultures.

Evaluate the use of questionnaires to investigate human behaviour.
