Type MS · Gregory's constructivist theory of perception

Answer 1 of 7 · Question 25 part whole · 4 marks

2025 JUN · Paper 02 · extract 1 of 2 · find part whole in this mark scheme extract

Question Number	Answer	Mark
25	**One** mark for identification of a strength/weakness (maximum **two** marks). **One** mark for justification, which must be linked to the strength/ weakness identified (maximum **two** marks). For example: Strength • It provides an explanation of why Rhonda can see both the rabbit and duck, as they are both equally plausible explanations, but the brain can only focus on one at a time (1). Gregory (1970) states that when the visual information is received, the brain may develop two equally plausible hypotheses and is unable to decide and so 'flips' between the two (1). • It provides an explanation of why Rhonda can see both the rabbit and duck as due to past experiences they are both equally plausible explanations (1) Gregory (1970) states that when the visual information is received, the brain may develop two equally plausible hypotheses due to prior knowledge and experience and is unable to decide and so 'flips' between the two (1). • Weakness • Visual illusions are artificial, two-dimensional objects, so if Rhonda was given more contextual information she would not flip between the duck and the rabbit (1). Gibson (1966) states than in the real world there is enough rich sensory information given through vision to mean that perceptual hypothesis testing is not needed (1). • It may be that the image seen depends purely on the part of the visual image that Rhonda is attending to at the time (1) as studies have shown that babies can perceive object without prior knowledge showing that perceptual hypothesis is not needed (1). Accept any other appropriate response.	**(4)**

Type MS · Gregory's constructivist theory of perception

Answer 2 of 7 · Question 25 part whole · 2 marks

2019 JUN · Paper 02 · find part whole in this mark scheme extract

Question number	Answer	Mark
25	**One** mark for identification of a reason **One** mark for reasoning/justification of reason identified, which must be linked to the theory. For example: • Carly would need prior knowledge to understand the movement of the car she was perceiving and not just her sensory input (1). Gregory (1970) explained that without prior knowledge Carly would not have a schema for cars so would not be able to determine the actions of the car, such as speed (1). Accept any other appropriate response.	**(2)**

Type MS · Gregory's constructivist theory of perception

Answer 3 of 7 · Question 21 part whole · 1 mark

2020 NOV · Paper 02 · find part whole in this mark scheme extract

Question number	Answer	Mark
21	**One** mark for knowledge of a perceptual hypothesis. • When 'best guesses' about visual information are made, in order for a person to attempt to process and make sense of the sensory input (1). Accept any other appropriate response.	**(1)**

Type MS · Gregory's constructivist theory of perception

Answer 4 of 7 · Question 28 part whole · 9 marks

2021 NOV · Paper 02 · extract 1 of 3 · find part whole in this mark scheme extract

Question number	Indicative content	Mark
28	AO1 = 3 marks; AO2 = 3 marks; AO3 = 3 marks Markers must apply the descriptors in line with the general marking guidance (on pages 2–3). Due to the intrinsic links between the skills, if a response evidences performance against only one trait/skill it will be for demonstrating knowledge and understanding. An answer displaying qualities of AO1 only, cannot be awarded more than the top of Level 1, no matter how strong the performance is in AO1. AO1 • Gregory (1970) claims that perceiving objects requires the formulation of a hypothesis to make a best guess at what we are seeing. • Sensory input is interpreted using cognitive information from prior knowledge and experience to help understand what is being seen. • Gregory (1970) believes around 90% of information is lost between the visual input of information and reaching the brain for processing understanding of the visual information. AO2 • An incorrect perceptual hypothesis can explain why Archie perceived the lines and squares to be different to their actual form. • Archie may have used prior knowledge of brickwork, shape and colour to interpret the size and shape of the rows in the visual illusion. • Archie may have lost information about each individual square and line in the image so only 10% of the visual input is being processed. AO3 • Evidence from Gregory (1970) using illusions such as the 'necker cube' and the 'hollow mask' demonstrate humans make errors in perception and form incorrect hypotheses. • The theory is holistic as it takes into account multiple factors, such as the experiences of the individual, that build on prior knowledge, so it can explain why Archie is confused by the illusion but other people may not be. • Gregory (1970) used artificial images to test his theory so his explanation of perceptual hypothesis and visual input may not reflect how Archie would interpret real-life visual input.	**(9)**

Answer 4 of 7 · Question 28 part whole · 9 marks

2021 NOV · Paper 02 · extract 2 of 3 · find part whole in this mark scheme extract

Level	Mark	Descriptor
	0	No rewardable material.
Level 1	1–3	• Demonstrates isolated elements of knowledge and understanding of a limited range of psychological ideas (AO1). • Provides little or no reference to relevant psychological ideas related to the context (AO2). • Limited attempt to deconstruct relevant psychological ideas. Limited consideration of supporting/refuting evidence, leading to generic judgements (AO3).
Level 2	4–6	• Demonstrates mostly accurate understanding of some relevant psychological ideas (AO1). • Provides some reference to relevant psychological ideas related to the context but this may be limited or lack relevance at times (AO2). • Deconstructs relevant psychological ideas using mostly logical chains of reasoning. Some consideration of supporting/refuting evidence, leading to a judgement (AO3).
Level 3	7–9	• Demonstrates accurate and thorough knowledge and understanding of relevant psychological ideas (AO1). • Provides sustained reference to relevant psychological ideas related to the context (AO2). • Deconstructs relevant psychological ideas using logical chains of reasoning. Sustained consideration of supporting/refuting evidence, showing an awareness of competing arguments, leading to a judgement (AO3).

Sleep and dreaming – Why do you need to sleep and dream?

Type MS · Gregory's constructivist theory of perception

Answer 5 of 7 · Question 25 part whole · 4 marks

2022 JUN · Paper 02 · extract 1 of 2 · find part whole in this mark scheme extract

Question number	Answer	Mark
25	**One** mark for identification of each way (maximum **two** marks). **One** mark for justification which must be linked to the way identified (maximum **two** marks). For example: • Marigold may have formed a perceptual hypothesis based on prior knowledge from recently seeing vase and firstly perceived the illusion to be a picture of a vase (1) because prior knowledge helps observers to fill in any gaps from our sensory input to try and make sense of what is being perceived (1). • Marigold may see two images because she is able to determine from stored information about a vase and faces that both of these images are visible (1), as we can test the perceptual hypothesis of what we see based on experiences which means observers can perceive an image in multiple ways (1). Accept any other appropriate response.	**(4)**

Answer 7 of 7 · Question 27 part whole · 9 marks

2024 JUN · Paper 02 · extract 1 of 3 · find part whole in this mark scheme extract

Question number	Indicative content	Mark
27	AO1 = 3 marks; AO2 = 3 marks; AO3 = 3 marks Markers must apply the descriptors in line with the general marking guidance (on pages 2–3). Due to the intrinsic links between the skills, if a response evidences performance against only one trait/skill it will be for demonstrating knowledge and understanding. An answer displaying qualities of AO1 only, cannot be awarded more than the top of Level 1, no matter how strong the performance is in AO1. AO1 • Gregory (1970) claims that perceiving objects requires a hypothesis to be formed from which a person makes a best guess at what they see around them. • Cognitive information from prior knowledge is used to interpret sensory input to help understand what is being seen. • Individuals can make a biased interpretation of sensory input because of expectations, emotions, and motivations. AO2 • Shamila's hypothesis may now include suspicion of people around her, particularly those with their hood up, from which her best guess perceives those people as a threat. • Shamila has experienced her bag being stolen on her walk home which now informs her understanding of the journey home from work, influencing what she sees. • The worry of being attacked again may have heighted Shamila's fear, so her interpretation of the people she saw was made with a bias towards danger and being unsafe. AO3 • Evidence using illusions, such as the 'Necker cube', shows how people make errors in perception to form incorrect hypotheses like Shamila may have done with the people she saw. • The theory considers multiple factors that influence individual perception, such as personal experiences that inform prior knowledge, hence why Shamila perceived people to be staring at her bag, but her friend did not. • However, according to bottom-up processing, there would not be errors in Shamila's perception, so she may have accurately perceived people staring and a genuine potential threat from the person with their hood up.	**(9)**
